

IDEATION & SOLUTION DISCOVERY

Medical Diagnosis Center

ServiceNow | Brainstorming • Concept Development • Prioritization

Document Phase	Ideation
Project Platform	ServiceNow
Project Type	Healthcare Service & Diagnostic Request Management
Decision Model	Value × Feasibility
Version	1.0

1. Why This Ideation Was Started

The ideation began with the challenge of managing patient-facing healthcare services through multiple disconnected or manual processes. Patients may need to contact healthcare staff separately for appointments, diagnostic requests, status updates, reports, and service-related communication.

The objective is to create a centralized Medical Diagnosis Center using ServiceNow Service Portal, where patients can access healthcare services through a structured digital experience.

Instead of beginning with individual ServiceNow features, the solution considers the complete patient-service journey—from submitting a request and scheduling an appointment to diagnostic processing, status communication, report availability, and service closure.

The first release will focus on functions that can be demonstrated effectively within the ServiceNow environment while keeping clinical decisions under qualified healthcare professionals.

2. Problem Framing Canvas

Question	Medical Diagnosis Center
Who experiences the problem?	Patients, doctors, laboratory technicians, reception/support staff, and healthcare administrators.
What is difficult today?	Patients may depend on manual communication for appointments, diagnostic requests, service status, and report availability. Healthcare teams also need to coordinate patient requests across different stages.
Where is the opportunity?	Create one controlled ServiceNow portal journey for patient service requests, appointments, diagnostic processing, communication, and tracking.
What should improve?	Accessibility, request consistency, appointment coordination, status visibility, communication, service turnaround, and patient experience.
What should not be automated blindly?	Medical diagnosis, clinical interpretation, treatment decisions, and other decisions requiring qualified healthcare professionals.
What is the first-release boundary?	Service Portal + healthcare service catalog + guided request + appointment workflow + diagnostic task management + Flow Designer + notifications + status tracking + controlled access.

3. Opportunity Areas

Area	Opportunity
A — Access	Make healthcare and diagnostic services easy for patients to discover through the ServiceNow Service Portal.
B — Capture	Collect complete and consistent patient service, appointment, and diagnostic-request information through guided forms.

Area	Opportunity
C — Schedule	Coordinate appointment requests, available services, and required healthcare staff.
D — Orchestrate	Use Flow Designer to coordinate requests, assignments, tasks, status changes, and notifications.
E — Serve	Provide doctors, laboratory technicians, and support teams with structured tasks and the information required to handle patient services.
F — Inform	Keep patients informed about appointments, request progress, important updates, and report availability.
G — Govern	Protect healthcare information through roles, ACLs, controlled access, and traceable activities.
H — Learn	Use service data and reports to understand request volume, appointment patterns, processing delays, and opportunities for improvement.

4. Idea Cards — From Problem to Solution

ID	Concept	What It Solves	Value	Feasibility	Release
01	Guided Patient Service Request	Provides a simple portal experience for patients to request healthcare services with relevant information.	High	High	MVP
02	Patient Request Quality Gate	Checks mandatory request information before the request enters the healthcare workflow.	High	High	MVP
03	Appointment Coordinator	Creates a structured process for appointment requests, confirmation, and status management.	High	High	MVP
04	Diagnostic Workflow Orchestrator	Uses Flow Designer to coordinate request stages, assignments, tasks, status transitions, and notifications.	High	High	MVP
05	Healthcare Work Task	Provides doctors, lab technicians, or support staff with structured work records containing the information required to process the service.	High	High	MVP
06	Patient Lifecycle Visibility	Allows patients to track meaningful stages such as Submitted, Scheduled, In Progress, Report Available, and Closed.	High	High	MVP
07	Healthcare Access Guardrail	Uses roles and ACLs to control which patient/service information different users can access.	High	Medium–High	MVP
08	Healthcare Service Analytics	Reports and dashboards identify request volumes, appointment patterns, processing stages, and service bottlenecks.	Medium–High	Medium–High	Phase 2
09	External Healthcare Connector	Future integration with laboratory, hospital, or other healthcare information systems.	High	Medium–Low	Future
10	AI Patient Service Assistant	Future AI-assisted classification, summarization, or routing of patient service requests with human oversight.	Medium–High	Low–Medium	Future

5. Concept Fusion — The Strongest End-to-End Journey

Stage	Process
1. Discover	Patient opens the ServiceNow Service Portal and browses available medical/diagnostic services.
2. Request	A guided form collects the required service and appointment information.
3. Validate	Required request information is checked for completeness.
4. Schedule	The appointment/service request follows the defined scheduling and assignment process.
5. Orchestrate	Flow Designer coordinates tasks, assignments, status transitions, and notifications.
6. Diagnose / Serve	The responsible healthcare professional or diagnostic team performs the required service and updates the work record.
7. Inform	Patients receive important appointment, status, and report-availability notifications.
8. Close & Learn	The service request is completed, recorded, and made available for reporting and service improvement.

6. Decision Framework

Criterion	Question	High Score Means	Why It Matters	Used For
Patient Value	Does it directly improve the patient service experience?	Strong patient benefit	Keeps the solution patient-focused	MVP Selection
Feasibility	Can it be implemented using available ServiceNow capabilities?	Practical to build	Controls scope and implementation risk	MVP Selection
Automation Value	Does it remove repetitive administrative work?	High automation potential	Improves service coordination	MVP Selection
Governance Value	Does it improve access control, traceability, or accountability?	Stronger governance	Important when handling healthcare-related information	Architecture
Dependency	Does it require external hospital/laboratory systems?	Few dependencies	Makes the first release easier to demonstrate	Release Planning

7. Priority Zones

Zone	Meaning	Ideas
BUILD NOW — MVP	High Value + High Feasibility	Patient Service Portal → Guided Request → Information Validation → Appointment Workflow → Diagnostic Task → Flow Designer → Notifications → Status Tracking → Role-Based Access.
BUILD NEXT — Phase 2	Useful healthcare service improvements with manageable implementation effort	Reports → Dashboards → Appointment Analytics → Diagnostic Turnaround Analysis → Patient Feedback → Service Performance Monitoring.

Zone	Meaning	Ideas
EXPLORE LATER — Future	High potential but dependent on external systems, data, integrations, or additional governance	AI Patient Assistant → External Laboratory Integration → Hospital System Integration → Advanced Scheduling → Predictive Analytics.

8. Selected Concept

Medical Diagnosis Center is a ServiceNow Service Portal solution that transforms patient-facing healthcare services into a controlled digital workflow: guided service submission, appointment coordination, request validation, automated workflow orchestration, structured healthcare tasks, patient notifications, status tracking, controlled information access, and traceable service closure. The platform manages the service workflow around healthcare delivery. Medical diagnosis and clinical decisions remain the responsibility of qualified healthcare professionals.

9. What Makes the Concept Distinct

- Patient-journey-first design: The system is organized around the patient's complete service journey instead of simply demonstrating unrelated ServiceNow features.
- Single digital service entry point: Patients can use one portal for medical service requests, appointments, diagnostic-related requests, tracking, and communication.
- Workflow-driven coordination: ServiceNow Flow Designer coordinates administrative workflow between patients, doctors, laboratory teams, and support staff.
- Human-in-the-loop healthcare: Automation manages service processes but does not replace doctors or automate clinical decisions.
- Lifecycle visibility: Patients can see meaningful progress rather than repeatedly contacting healthcare staff for updates.
- Governance by design: Roles, ACLs, and controlled access are incorporated into the architecture rather than added after development.
- Expandable architecture: Analytics, AI assistance, laboratory integration, and external healthcare-system integrations can later be introduced without overloading the first release.

10. Ideation Outcome

The brainstorming stage results in a focused Medical Diagnosis Center rather than a collection of unrelated healthcare features. The first implementation will concentrate on the patient request-to-service-completion lifecycle: Patient → Service Portal → Medical Request → Validation → Appointment → Healthcare Task → Diagnostic/Service Processing → Status Update → Patient Notification → Completion. Advanced capabilities such as external laboratory integration, hospital-system integration, predictive analytics, and AI-assisted services will remain separate future enhancements until the core workflow is stable.
