

PROJECT DESIGN PHASE-II

Medical Diagnosis Center | Problem–Solution Fit Canvas 2.0

Medical Diagnosis Center • ServiceNow Service Portal • 06 October 2026

Date	06 October 2026	Project	Medical Diagnosis Center
Platform	ServiceNow Service Portal	Purpose	Validate problem–solution fit against the demonstrated diagnostic-test booking and report workflow

1. CUSTOMER SEGMENT(S)

- Primary: Patients / service requesters who use the ServiceNow Service Portal to browse diagnostic tests, book an appointment, provide patient information and view available lab reports.
- Secondary: Diagnostic / service operations staff responsible for managing appointment and diagnostic-test records.
- Supporting users: Authorized users who review appointment status, patient information, diagnostic-test information and generated report records.
- Platform stakeholder: ServiceNow administrators responsible for configuring the portal, Medical Test Catalog, Appointment Booking, My Appointments, My Lab Reports, tables, business rules, roles and ACLs.

2. JOBS-TO-BE-DONE / PROBLEMS

- Find a required diagnostic test through a patient-facing Medical Test Catalog.
- Select a test and start booking without relying on separate manual coordination.
- Enter patient information once through the booking Details step.
- Select an appointment slot through the Schedule step.
- Complete the configured Payment step and reach the Done stage.
- View the created appointment and its current status through My Appointments.
- Generate and access a diagnostic report after the appointment reaches the configured completed state.
- Maintain connected Patient, Diagnostic Test, Appointment and Report records so the booking-to-report journey remains traceable.

3. TRIGGERS

- A patient needs a diagnostic test and opens the Medical Diagnostic Test Center.
- A patient selects a diagnostic test and chooses Book Now.
- The booking process requires patient details, scheduling and the configured payment step.
- An appointment reaches the configured completed state, triggering report creation.
- The patient wants to check appointment progress or view an available lab report.

4. BEHAVIOUR: BEFORE / DURING / AFTER

Stage	Patient / Operational Behaviour
Before	The patient needs a diagnostic test and opens the Medical Diagnostic Test Center. The patient browses available diagnostic tests.
During	The patient selects a test, clicks Book Now, completes Details, Schedule and Payment, and reaches Done.
Appointment stage	The created appointment is stored in the Appointment table and can be viewed through My Appointments.
Report stage	When the appointment reaches the configured completed state, the Auto Create Report on Appointment Complete business rule creates the related report record.
After	The patient opens My Lab Reports to view available diagnostic reports. Appointment and report records retain the service history.

5. AVAILABLE SOLUTIONS / CURRENT APPROACHES

- Manual diagnostic booking: can require repeated patient information, phone coordination and manual appointment handling.
- Unstructured communication: may make test availability, booking status and report availability difficult to track in one place.
- Standalone records: may store patient, appointment or report data separately without a connected patient-facing journey.
- ServiceNow Medical Diagnostic Test Center: combines a patient-facing test catalog, booking wizard, appointment records and report generation/access within the configured ServiceNow application.

6. CUSTOMER CONSTRAINTS

- The patient-facing booking experience must remain simple and understandable.
- Patient information must be captured consistently in the Details step.
- Only available/valid appointment slots should be selectable in the Schedule step.
- The Payment step must complete according to the configured implementation before the booking reaches Done.
- Appointment status and report availability must remain traceable through the implemented records.
- Patient and diagnostic information requires appropriate ServiceNow roles and ACLs.
- The current screenshots do not demonstrate external hospital/EMR/LIS integrations, AI diagnosis or clinical decision support; these must remain outside the claimed current scope.

7. CUSTOMER NEEDS / EXPECTED OUTCOMES

- Patient: easy test discovery, straightforward booking, appointment visibility and report access.
- Diagnostic operations: structured Diagnostic Test and Appointment records with patient references.
- Report operations: a related Report record created when the appointment reaches the configured completed state.
- ServiceNow administrator: maintainable portal components, tables, business rules and access controls.
- Organization: a connected digital diagnostic-service journey from test selection to appointment and report availability.

8. CHANNELS OF BEHAVIOUR

- Patient-facing online channel: Medical Test Catalog, Appointment Booking, My Appointments and My Lab Reports widgets/pages.
- Booking channel: Details → Schedule → Payment → Done.
- Operational channel: Patient, Diagnostic Test, Appointment and Report tables.

- Automation channel: Auto Create Report on Appointment Complete business rule.
- Administrative channel: ServiceNow table configuration, business-rule configuration and access controls.

9. PROBLEM ROOT CAUSE

- Diagnostic-test discovery, appointment booking and report access can become fragmented when handled through separate manual channels.
- Patient information may need to be entered repeatedly if booking does not provide a structured Details step.
- Appointment scheduling can become difficult to track without a dedicated Appointment record and patient-facing My Appointments view.
- Report generation and availability can be disconnected from appointment completion without an automated relationship.
- Separate Patient, Diagnostic Test, Appointment and Report data can become inconsistent without clear references between records.
- Sensitive patient/report information requires controlled access.

10. YOUR SOLUTION

- A ServiceNow-based Medical Diagnostic Test Center with a patient-facing Medical Test Catalog.
- Diagnostic-test cards provide test information and a Book Now action.
- Appointment Booking implements a four-stage journey: Details → Schedule → Payment → Done.
- Patient information is captured through the booking Details step and associated with the appointment.
- Appointment records maintain scheduling/status information and are surfaced through My Appointments.
- The Auto Create Report on Appointment Complete business rule creates the related Report record when the appointment reaches the configured completed state.
- My Lab Reports provides the patient-facing report-access view.
- Patient, Diagnostic Test, Appointment and Report tables provide the demonstrated data foundation.
- Roles and ACLs can be used to control access to patient and report information.

PROBLEM–SOLUTION FIT SUMMARY

Fit Area	Assessment
Problem fit	Aligned — the solution directly addresses fragmented test discovery, booking, appointment visibility and report availability.
Workflow fit	Aligned — the demonstrated journey is Medical Test Catalog → Book Now → Details → Schedule → Payment → Done → Appointment → Completed → Auto Create Report → My Lab Reports.
Stakeholder fit	Aligned — the design primarily serves patients and diagnostic/service operations while providing administrator configuration and control.
Scope fit	Controlled — the current evidence supports the portal booking, appointment and report workflow; clinical diagnosis, external integrations and AI decision support are not claimed.
