

PROJECT DEVELOPMENT PHASE

Artificial Intelligence Model Performance Test

Medical Diagnosis Center by Service Portal (ServiceNow)
Date: 02 October 2026 | Maximum Marks: 4 Marks

Model Performance Testing

The current Medical Diagnosis Center implementation does not contain an Artificial Intelligence, Machine Learning, or Generative AI model. The implemented behaviour is configuration- and workflow-driven inside ServiceNow. Therefore, AI model-training metrics are recorded as N/A rather than invented.

S.No.	Parameter	Values / Evidence	Evidence
1	AI Model Summary	N/A – No AI/GenAI model is implemented. The solution uses ServiceNow Service Portal, Medical Test Catalog, booking workflow, Appointment and Report records, configured automation, notifications and access controls.	ServiceNow implementation evidence
2	Accuracy	N/A – No predictive AI model exists. Behaviour is validated through the diagnostic-test catalog, booking stages, appointment completion, automatic report creation and My Lab Reports flow.	Functional / end-to-end evidence
3	Fine-Tuning / Prompt Evaluation	N/A – No AI model, prompt-based assistant or model fine-tuning is implemented in the current version.	Not Applicable

Current AI Performance Validation Approach

- Catalog validation: verify diagnostic tests are displayed and selectable.
- Booking validation: verify Book Now moves through Patient Details → Schedule → Payment → Done.
- Appointment validation: verify the expected Appointment record is available after booking.
- Lifecycle validation: verify My Appointments reflects the appointment state and completion.
- Automation validation: verify Appointment Completed triggers the configured Report creation.
- Report validation: verify the created Report is available through My Lab Reports.
- Security validation: verify only authorized users can access applicable patient, appointment and report information.
- Execution validation: inspect the relevant ServiceNow automation/execution details for failures and record updates.

Conclusion

Because the current project is a deterministic ServiceNow diagnostic workflow rather than an AI model, training accuracy, validation accuracy, model precision/recall, fine-tuning and prompt-evaluation metrics are N/A. Performance is demonstrated through functional and end-to-end workflow evidence.
