

PROJECT DEVELOPMENT PHASE

Machine Learning Model Performance Test

Medical Diagnosis Center by Service Portal (ServiceNow)
Date: 02 October 2026 | Maximum Marks: 4 Marks

Model Performance Testing

Machine-learning performance metrics are not applicable to the current Medical Diagnosis Center implementation because it does not contain a regression or classification model. The current solution is deterministic and configuration-driven in ServiceNow; therefore ML metrics are recorded as N/A rather than invented.

S.No.	Parameter	Values / Evidence	Evidence
1	Metrics	Regression: MAE – N/A; MSE – N/A; RMSE – N/A; R^2 – N/A. Classification: Confusion Matrix – N/A; Accuracy – N/A; Classification Report – N/A. Reason: no trained ML model exists.	Not Applicable
2	Tune the Model	Hyperparameter tuning – N/A. Validation method – N/A. The project instead validates the implemented diagnostic booking, appointment, automation and report lifecycle.	Functional / UAT / workflow evidence

Alternative Performance Validation Used in This Project

- Diagnostic-test catalog validation: verify configured tests can be selected.
- Booking-flow validation: verify Book Now, Patient Details, Schedule, Payment and Done execute in the intended order.
- Appointment validation: verify the booked Appointment is created and visible in My Appointments.
- Completion automation validation: verify Appointment Completed triggers the configured Report creation.
- Report validation: verify the Report is available in My Lab Reports.
- Data validation: verify patient, selected test, appointment and report values are stored correctly.
- Security validation: verify configured ACL/role behaviour for applicable records.
- Execution validation: inspect ServiceNow automation execution details and record updates.

Conclusion

No regression or classification model is implemented in the current ServiceNow solution, so MAE, MSE, RMSE, R^2 , confusion matrix, accuracy score, classification report, hyperparameter tuning and ML validation metrics are N/A. Project performance is demonstrated through functional, workflow, data and UAT evidence.
