

PROJECT DEVELOPMENT PHASE

Power BI Performance Test

Medical Diagnosis Center by Service Portal (ServiceNow)
Date: 02 October 2026 | Maximum Marks: 4 Marks

Performance Testing

Power BI is not part of the current Medical Diagnosis Center implementation. The current solution uses ServiceNow records for diagnostic-test selection, patient data, appointment tracking, appointment completion and report records. Power BI analytics and dashboards remain future scope, so the test records below do not claim unimplemented reports, visualizations, filters or DAX queries.

S.No.	Parameter	Screenshot / Values	Evidence
1	Data Rendered	N/A – No Power BI report is implemented. Current data is presented through ServiceNow portal views such as Medical Test Catalog, My Appointments and My Lab Reports.	Not Applicable
2	Data Preprocessing	N/A – Patient, diagnostic-test, appointment and report data is stored and processed in ServiceNow records/tables, not Power BI.	Not Applicable
3	Utilization of Data Filters	N/A – No Power BI slicers or report filters are implemented.	Not Applicable
4	DAX Queries Used	N/A – DAX is not used in the current project.	Not Applicable
5	Dashboard Design	0 Power BI visualizations/graphs in the current version. Advanced analytics/dashboard capability is future scope.	Not Applicable
6	Report Design	0 Power BI report visualizations/graphs in the current version.	Not Applicable

Current Analytics Boundary

- Current: Medical Test Catalog, Patient, Diagnostic Test, Appointment and Report information is maintained inside ServiceNow records/configured tables.
- Current: My Appointments and My Lab Reports provide patient-facing lifecycle/report visibility through ServiceNow.
- Current: workflow/automation execution and operational status can be inspected within ServiceNow.
- Future: Power BI dashboards, report visualizations, slicers/filters, DAX calculations and advanced diagnostic analytics can be considered as extensions.
- No Power BI implementation evidence is claimed in the current project.

Conclusion

The current project does not contain a Power BI reporting layer. Therefore, Power BI data rendering, preprocessing, filters, DAX, dashboard design and report design are N/A or zero where appropriate. The implemented solution is validated through ServiceNow diagnostic-test, patient, appointment, automation and report records. Power BI analytics remains a future enhancement.
