

PROJECT DEVELOPMENT PHASE

Tableau Performance Test

Medical Diagnosis Center by Service Portal (ServiceNow)

Date: 02 October 2026 | Maximum Marks: 4 Marks

Tableau is not used in the current implementation. Tableau-specific performance evidence is therefore N/A. The equivalent current data-processing and operational activities are handled within ServiceNow through the Medical Test Catalog, Patient/Appointment/Report records, portal views and configured workflow automation.

S.No.	Parameter	Values	Screenshot / Evidence
1	Data Rendered	N/A – No Tableau workbook or dashboard is implemented. Diagnostic-test, appointment and report information is rendered through ServiceNow portal experiences such as Medical Test Catalog, My Appointments and My Lab Reports.	Not Applicable; ServiceNow portal/record evidence.
2	Data Preprocessing	N/A for Tableau. Current data preparation occurs through configured catalog fields, Patient Details, Schedule, record creation/mapping and appointment-completion automation.	ServiceNow booking and record evidence.
3	Utilization of Filters	N/A – No Tableau filters are implemented. Current patient-facing filtering/tracking is represented by My Appointments and My Lab Reports views.	Not Applicable for Tableau; ServiceNow portal views.
4	Calculated Fields Used	N/A – No Tableau calculated fields are implemented. Current behaviour uses ServiceNow record fields, configuration and workflow automation.	Not Applicable; ServiceNow field/workflow evidence.
5	Dashboard Design	0 – No Tableau dashboards or visualizations are implemented in the current version. Advanced analytics/dashboarding is future scope.	Not Applicable.
6	Story Design	0 – No Tableau story visualizations are implemented in the current version. Story-based analytics is future scope.	Not Applicable.

Current Analytics Boundary

- Current: Medical Test Catalog provides diagnostic-test discovery.
- Current: My Appointments provides appointment/lifecycle visibility.
- Current: My Lab Reports provides report visibility after the configured report record is created.
- Current: Appointment and Report records are maintained inside ServiceNow.
- Future: Tableau dashboards, filters, calculated fields, stories and advanced analytics can be considered only if separately implemented.

Conclusion

The current project does not contain a Tableau analytics layer. Therefore Tableau-specific rendering, preprocessing, filters, calculated fields, dashboards and story visualizations cannot be performance-tested from the present implementation. The current data-processing and workflow behaviour is validated within ServiceNow.
